DESIGN TOOLS

Supporting theories and geometry definition

Supersonic aerodynamics:
Area rule (Lomax)
Minimum drag bodies (Sears, Haack, v.Karman)

Transonic aerodynamics:
Supercritical airfoils
Swept wings

Shape definition:
Geometry preprocessor for aerodynamic applications,
Parameter variation tailored by supporting theories.

SOBIECZKY, SEEBASS, LI & HANNEMANN 1998

INTRODUCTION

Oblique Flying Wing (OFW)

Optimum aerodynamics: Efficient at subsonic, transonic & supersonic
Mach numbers by variable sweep.

Optimum structure: Lift is produced where load is located.

Passenger transport: Passenger size defines min. wing section thickness,
Aerodynamics defines min. airfoil chord,
Efficiency defines min. wing span.

Example: ~800 pax OFW with large aspect ratio at Mach ~ 1.4;
Manual optimization for better understanding of
aerodynamic phenomena.

SOBIECZKY, SEEBASS, LI & HANNEMANN 1998

OFW

Constraints for shape definition

Elliptic lift distribution:

$$\text{load} \sim \gamma^{1/2}(1-\gamma)^{1/2}$$

Minimum drag equivalent body of revolution:

$$\text{area} \sim \gamma^{3/2}(1-\gamma)^{3/2}$$

Baseline shape:

elliptic wing planform,
parabolic bending.

SOBIECZKY, SEEBASS, LI & HANNEMANN 1998

SUPERSONIC THEORY

Comparison linear theory vs. CFD results

Elliptic wing, Sears-Haack area distribution:
symmetrical airfoil sections
drag coefficients resulting from linear theory and Euler CFD

SOBIECZKY, SEEBASS, LI & HANNEMANN 1998

TRANSONIC THEORY

Definition of thick baseline wing sections

Preliminary design: Thick shock-free wing section

Method: Fict. Gas, inviscid flow

Application of swept wing theory

Example: $M_n = 0.707$, $c_l = 0.6$, $\tau = 0.17$

Extraction of geometric parameters for airfoil definition

SOBIECZKY, SEEBASS, LI & HANNEMANN 1998

GEOMETRY GENERATOR

Wing tool with spanwise airfoil variation

Spanwise definition by shape functions:

planform, twist, dihedral, thickness factor and 11 airfoil parameters, $\mathbf{p} = (r_{le}, X_{up}, \dots)$

SOBIECZKY, SEEBASS, LI & HANNEMANN 1998

OFW

Spanwise parameter definition

11 airfoil parameters,
6 wing parameters :

....defined by simple functions along span,

controlling linear theories constraints,

supporting elliptic load distribution & reduced cross flow shocks

SOBIECZKY, SEEBASS, LI & HANNEMANN 1998

NUMERICAL ANALYSIS

Inviscid Flow

Computational grid: O-O, 193 x 41 x 33 pts

CFD code: CFL3D (Euler version).

Manual optimization process:
analysis runs at design conditions,
check of elliptic load approximation and
sectional pressure distributions,
----> selected parameter adjustments.

Improvements after 22 runs:
L/D from 14 to 21.3
section thickness from 17 to 19%

SOBIECZKY, SEEBASS, LI & HANNEMANN 1998

OFW: CFD ANALYSIS

Inviscid flow results

Chordwise pressure and spanwise load distribution

SOBIECZKY, SEEBASS, LI & HANNEMANN 1998

OFW: CFD ANALYSIS

Inviscid flow results for varying sweep and lift

SOBIECZKY, SEEBASS, LI & HANNEMANN 1998

OFW: CFD ANALYSIS

Inviscid flow visualization: isobars

SOBIECZKY, SEEBASS, LI & HANNEMANN 1998

OFW: CFD ANALYSIS

$M_\infty = 1.41$, inviscid flow, variation of sweep angle and lift

SOBIECZKY, SEEBASS, LI & HANNEMANN 1998

OFW: CFD ANALYSIS

Inviscid flow quality at design conditions

Isobar distribution visualization on wing surface and along CFD grid surfaces

SOBIECZKY, SEEBASS, LI & HANNEMANN 1998

OFW: CFD ANALYSIS

Inviscid flow quality at optimum L/D conditions

Isobar distribution visualization on wing surface and along CFD grid surfaces

SOBIECZKY, SEEBASS, LI & HANNEMANN 1998

OFW: CFD ANALYSIS

Inviscid lift / drag as a function of lift coefficient and sweep angle, $M_\infty = 1.41$

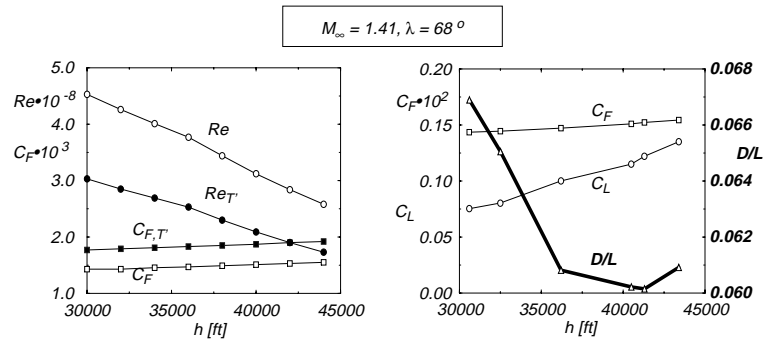

SOBIECZKY, SEEBASS, LI & HANNEMANN 1998

VISCOUS EFFECTS

$$\text{Drag} = \text{Lift} \{ (D/L)_{\text{inviscid}} + 2 C_F / C_L \}$$

SOBIECZKY, SEEBASS, LI & HANNEMANN 1998

OFW: OFF-DESIGN RESULTS

Euler CFD results

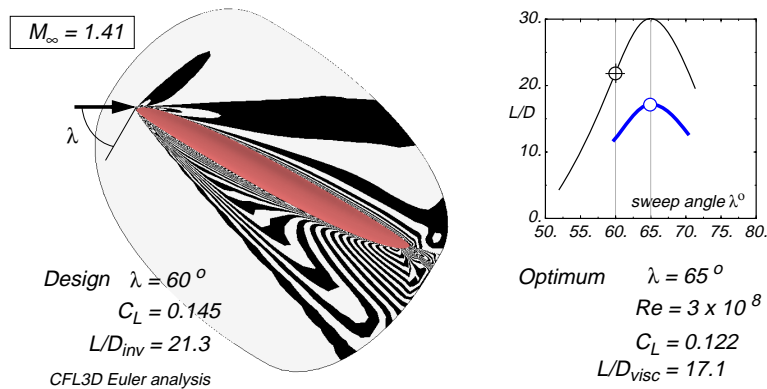

Sweep variation at fixed C_L and M_∞

SOBIECZKY, SEEBASS, LI & HANNEMANN 1998

Oblique Flying Wing

Test case for aerodynamic optimization

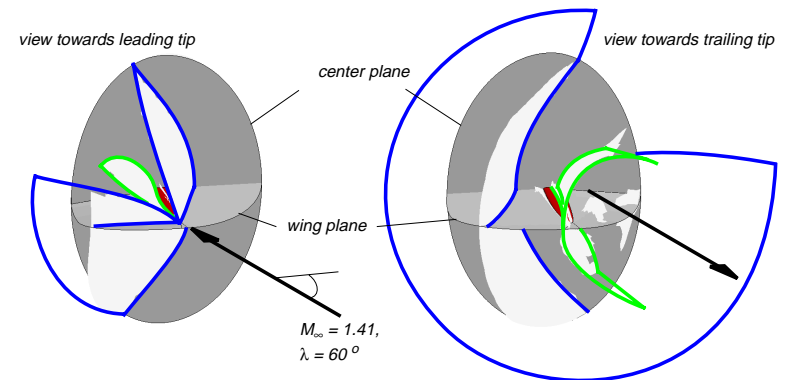

SOBIECZKY, SEEBASS, LI & HANNEMANN 1998

OFW: SHOCK STRUCTURE

Visualization of bow and tail wave system

SOBIECZKY, SEEBASS, LI & HANNEMANN 1998

SONIC BOOM OF AN OBLIQUE FLYING WING AIRCRAFT

$M_\infty = 1.414$, $h = 12.6$ km
Front shock strength Δp

SOBIECZKY, SEEBASS, LI & HANNEMANN 1998

SONIC BOOM OF AN OBLIQUE FLYING WING AIRCRAFT

$M_\infty = 1.414$, $h = 12.6$ km
Pressure signature Δp on the ground

SOBIECZKY, SEEBASS, LI & HANNEMANN 1998

OBLIQUE FLYING WING

Test case for multidisciplinary optimization

SOBIECZKY, SEEBASS, LI & HANNEMANN 1998

CONCLUSIONS

Results for candidate OFW :

<i>climb</i>	→	<i>accelerate</i>	→	<i>cruise</i>
Mach = 0.8		Mach = 1.1		Mach = 1.41
ML/D = 24.9		ML/D = 23.7		ML/D = 24.2
sweep = 40°		sweep = 56°		sweep = 65°
altitude = 30800 ft		altitude = 41300 ft		altitude = 41300 ft

Results for systematic design tools development:

A manual design and optimization exercise for a novel HSCT configuration, providing parameter identification for notable aerodynamic performance improvements.

SOBIECZKY, SEEBASS, LI & HANNEMANN 1998
